I have prepared a complete Bootstrap Online Shopping Platform project for your 9-hour hands-on training for second-year UG Computer Science students.

The project is named ShopEase. It demonstrates how to build a responsive e-commerce website step by step using HTML, CSS, Bootstrap 5, Bootstrap Icons, and JavaScript.

1. Download the complete project source code

ShopEase – Bootstrap E-commerce Project

ZIP archive · Complete source code · README and training plan

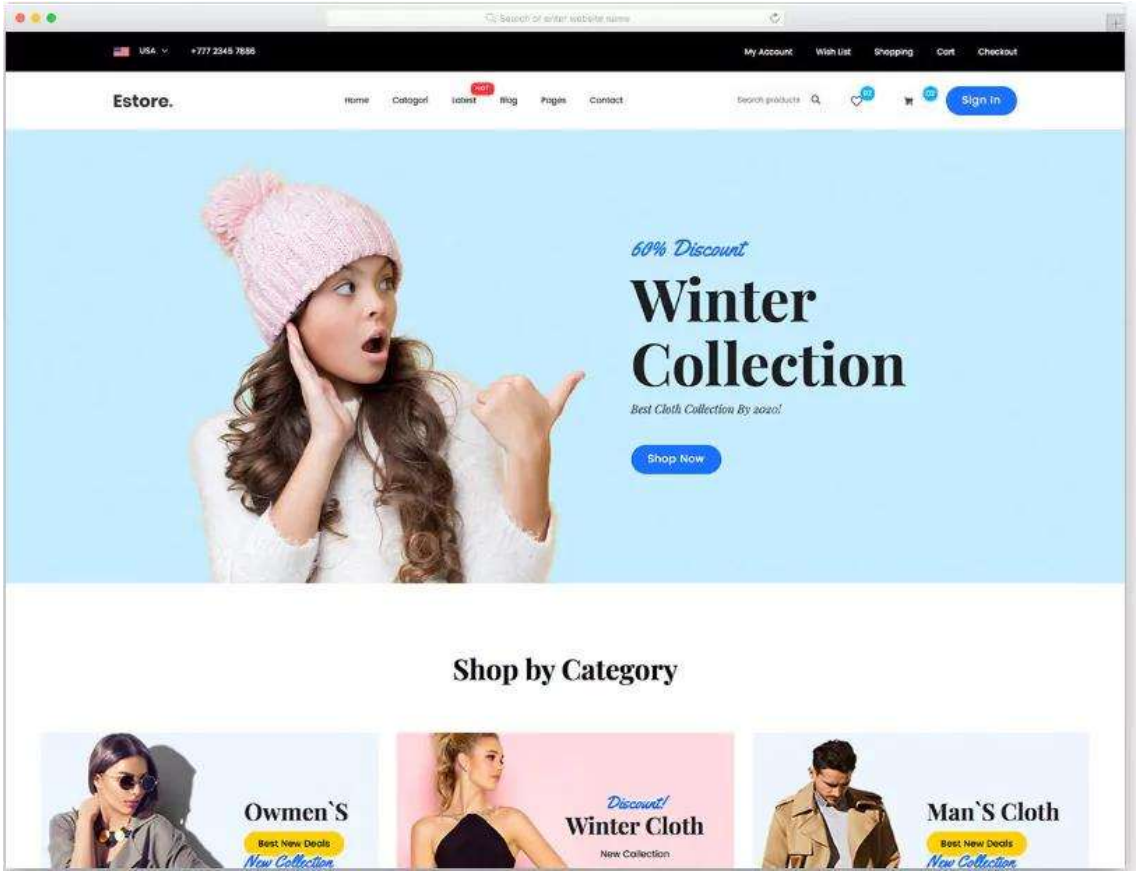

Ready to use

Download the complete project ZIP

Project includes

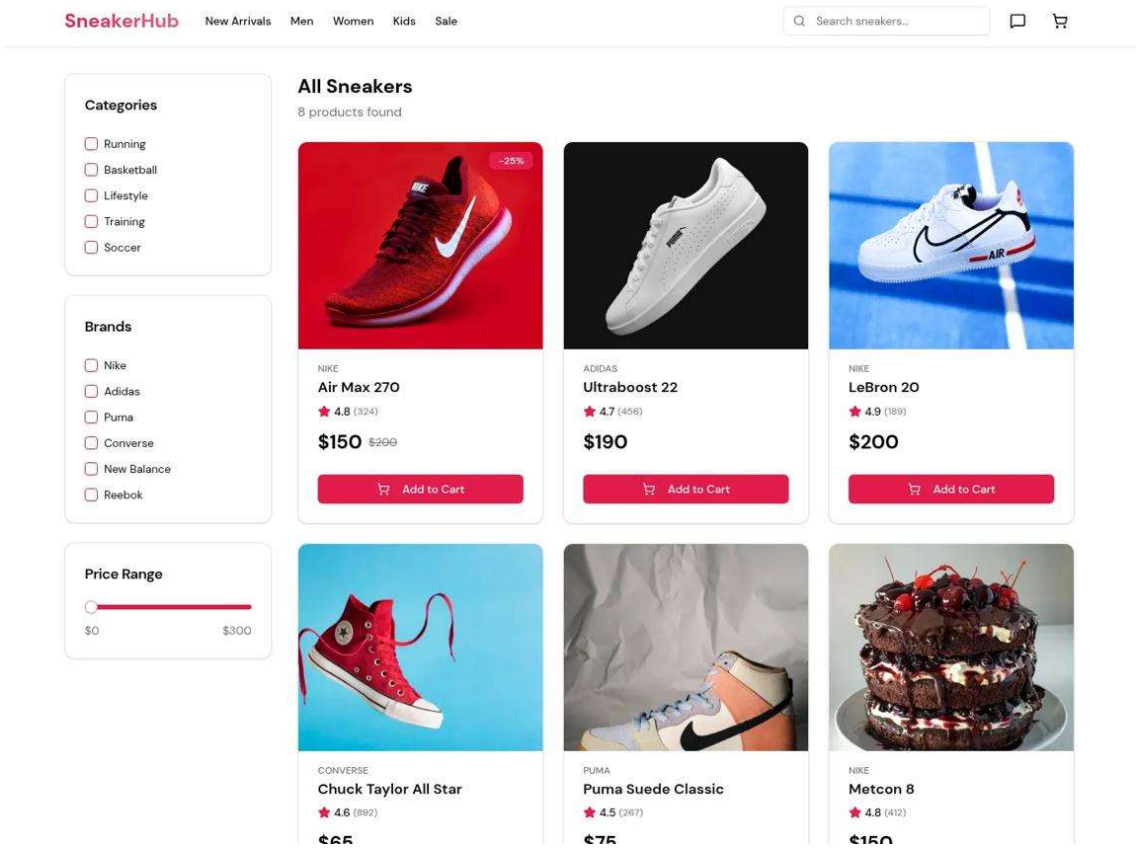

- index.html — complete website structure
- css/style.css — custom styling and responsive design
- js/app.js — product search, filtering, cart and checkout logic
- README.md — setup instructions and 9-hour training plan

2. What the finished project includes

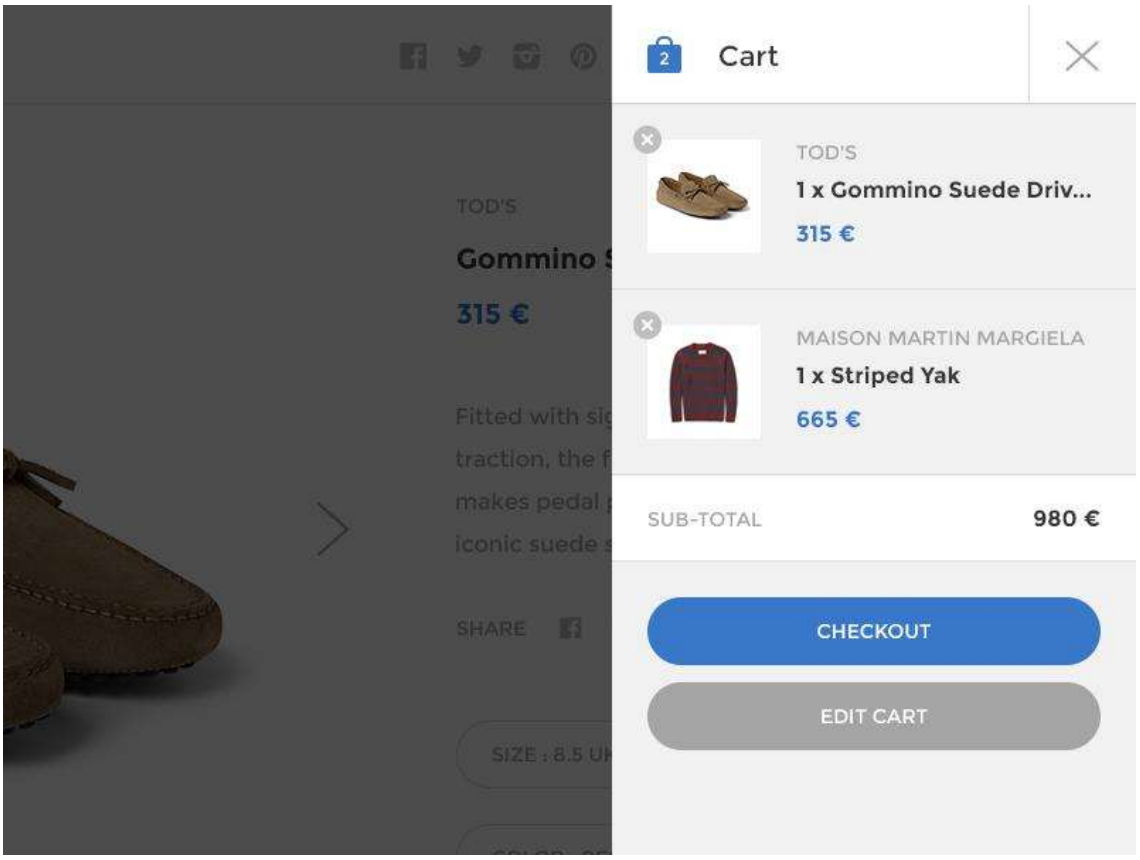

1. Responsive homepage

Navigation bar, promotional banner, hero section, shopping benefits, categories and footer. Students practise Bootstrap's grid, typography, spacing and responsive utilities.

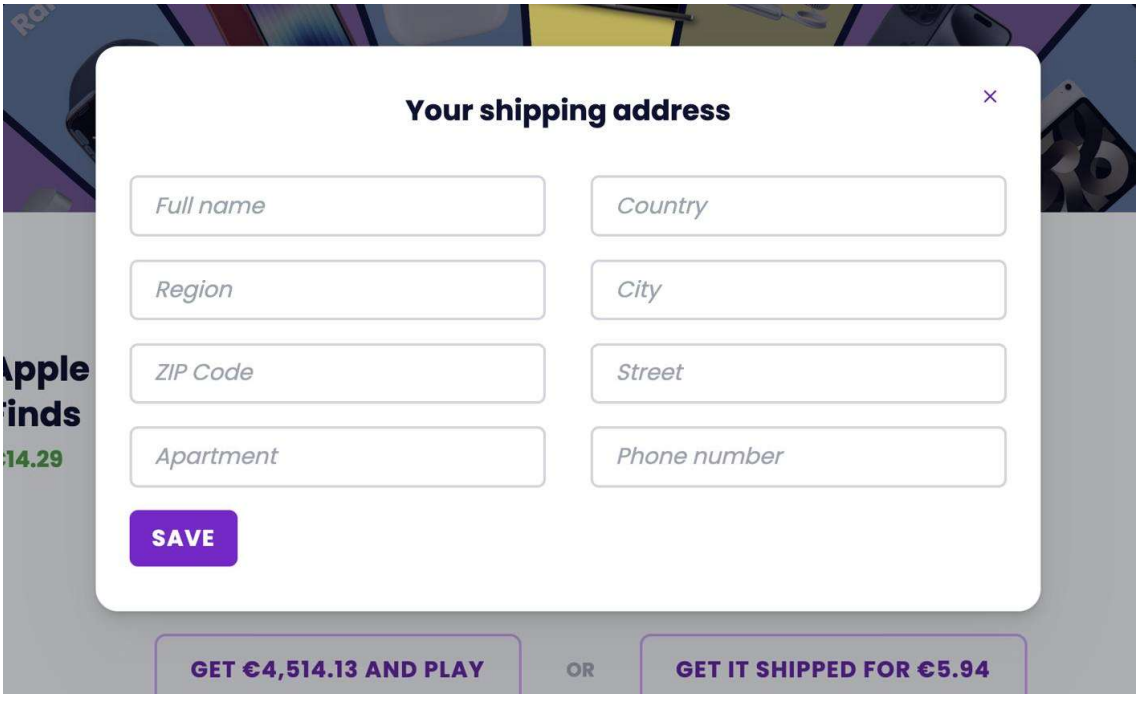

2. Product catalogue

Product cards, prices, ratings, product categories, search, category filtering and price sorting.

3. Shopping cart

Add products, increase or decrease quantities, remove items and calculate the subtotal using JavaScript and Bootstrap Offcanvas.

4. Checkout and forms

Customer details, delivery address, six-digit PIN validation, newsletter subscription and a demo order confirmation using Bootstrap Modal and form validation.

These images are illustrative references for the interface; the downloadable project contains the actual working source code.

3. Complete 9-hour hands-on training schedule

The following sequence lets you develop the project incrementally, introducing each Bootstrap concept when students need it.

01

60 min

Introduction to Bootstrap

Create the HTML page, connect Bootstrap through CDN, configure the viewport, and build the initial navbar and buttons.

Milestone: Basic ShopEase homepage.

02

60 min

Bootstrap Grid System

Practise containers, rows, columns, gutters, and responsive breakpoints such as col-6, col-md-4, and col-lg-6.

Milestone: Responsive hero, categories and product grid.

03

60 min

Layout Utilities

Use spacing, flexbox, alignment, display, backgrounds, borders, rounded corners and responsive visibility.

Milestone: Consistent layout on mobile and desktop.

04

60 min

Bootstrap Content & Typography

Apply heading classes, lead text, font weights, text colors, links, lists, badges and product descriptions.

Milestone: Polished homepage and readable product cards.

05

60 min

Bootstrap Components

Build the navbar, cards, buttons, badges, and shopping cart Offcanvas and checkout Modal.

Milestone: Interactive shopping interface.

06

60 min

Forms in Bootstrap

Create search, newsletter and checkout forms using labels, form controls, input groups, feedback messages and validation.

Milestone: Validated customer checkout form.

07

60 min

Bootstrap Helpers and Utilities

Practise visually hidden labels, responsive image handling, overflow, object-fit styling, spacing and utility combinations.

Milestone: Improve accessibility and responsive presentation.

08

60 min

Bootstrap Icons (Optional)

Add shopping cart, search, shipping, star ratings, benefits and navigation icons. Discuss accessible labels.

Milestone: More intuitive shopping controls.

09

60 min

Bootstrap JavaScript Plugins

Use Collapse, Offcanvas, Modal and validation alongside JavaScript product rendering, search, sorting and cart updates.

Milestone: Test the complete shopping journey and review the project.

Total training duration

9 hours

4. How to conduct the hands-on sessions

I recommend developing the project in this order:

1. Create the HTML skeleton and link Bootstrap.
2. Build the navbar and homepage layout.
3. Add the hero section, category cards and product grid.
4. Apply typography, colors and layout utilities.
5. Add product data and render product cards with JavaScript.
6. Implement search, category filtering and sorting.
7. Develop the cart using Offcanvas and quantity controls.
8. Build the checkout Modal and form validation.
9. Test the website on mobile and desktop.

This approach ensures students can see a working result after each stage instead of copying the entire project at once.

5. Setup instructions

1. Download and extract the ZIP file.
2. Open the project folder in Visual Studio Code.
3. Open index.html in a browser, or use the Live Server extension.
4. Keep an internet connection available for Bootstrap CDN files, Bootstrap Icons and product images.
5. Demonstrate the project, then ask students to modify products, prices, images and categories in js/app.js.

Important: This is a complete front-end training project, not a production-ready e-commerce system. It does not include a backend, database, user authentication, persistent orders or real payment processing. Those can be introduced in a later full-stack project.

Suggested student assessment: Ask each student to add one new product, create a new category, demonstrate responsive layout, filter products, update cart quantities and show checkout form validation.
